MQPERF1

Introduction to MQ SMF-Task and Channel Accounting Records

Agenda

- The Trident of record Types
  - No Aquaman jokes
- The Task report
  - It’s a detailed baby

MQ Accounting – The home of the devil

- The SMF 116 data is the task related data produced by an IBM MQ for z/OS queue manager.
  - Very detailed
  - Often necessary to track down performance problems
  - Costs vary by:
    - Application Style
    - SMF production type (MAN datasets or Logstreams)
    - Recently seen some examples of there being little to no overhead for collection and production of the data
    - Standard estimates are between 3-7% overhead

MQ Task Accounting

- These detailed records are actually made up of three components:
  - WTID – the Task Identifying Information
    - Macro – CSQDWTID
  - WTAS – The Task Statistics
    - Macro – CSQDWTAS
  - WQ – the Queue Use data (aka Queue Statistics)
    - Macro – CSQDWQ
  - All defined in the in the CSQDSMFC C header

WTID – What's in it

- The connection type:
  - CICS
  - Batch
  - IMS
  - CHIN
- Connection Name
  - The job name, can be the CICS region name, etc.
- Operator ID – User ID used by the task
- Correlator
  - For CICS transactions, this includes the Transaction ID and the Task identifier

WTAS – What's in it?

- This contains information that is task related, but not specific to a queue accessed by the task
- Latches: 0-31
  - MQ must serialize requests to some resources and uses latches to maintain that serialization
  - Extremely log latches can indicate problems with underlying resources or internal contention
  - Some latching is normal
  - But if they start becoming too long, time to look closer
    - (and we've seen some interesting things
- Longest latch elapsed time, latch type of the longest latch
- Other Requests – Number, CPU Time, Elapsed Time
  - These fields cover the requests that are not reflected in the queue level accounting data
    - This includes the costs associated with queues that are set to not collect the queue level data

WTAS – What's in it? - continued

- Commits – Number, CPU Time, Elapsed Time
- Backouts – Number, CPU Time, Elapsed Time
- Unforced Log Writes – Number, CPU Time, Elapsed Time
- Forced Log Writes – Number, CPU Time, Elapsed Time
- ….and many more – a lot having to do with CF, SMDS, and Db2

Queue accounting – known as the Queue Statistics

- Lots of very interesting info in this one
- Open Name – the name used for the MQOPEN
- Base Name – the resolved queue name
  - Might be an XMITQ, etc.
- Queue Type – Local, Model, etc.
- Index Type – Message ID, correlation ID, etc.
- QSG Disposition – Shared, etc.

Queue accounting – known as the Queue Statistics

- MQ API information
  - Collected for all the API types for the queue
    - Number of requests
    - CPU total
    - Elapsed Time total
  - Special for MQGET (not every field – but highlights):
    - Counts for the varieties of MQGETs
    - Invalid GET count
    - Number of pageset reads to fulfill an MQGET
    - Skipped messages
    - Expired messages
    - Valid MQGETs (returned data)
    - Number of bytes put
    - Max & Min Message sizes
    - Longest & shortest time on queue for retrieved message
    - Number of persistent messages retrieved
    - Maximum Queue depth

Queue accounting – known as the Queue Statistics

- MQ API information
  - Special for MQPUT & MQPUT1 (not every field – but highlights):
    - Put to waiting getter count
    - Pageset activity
    - Number of bytes PUT
    - Valid puts
    - Generated Message count
    - Max & Min message Sizes
    - Number of persistent messages put (or put1)
    - Maximum queue depth
    - Number of messages published to a topic
    - Count of messages to a shared queue
    - Count of messages to the IGQ
  - Location information
    - CF Structure, pageset and bufferpool data

Sample Task Output

```
8 MPX1,QML3,2013/06/17,06:21:15,VRM:710,
8 QML3 CICS CTSTOR01 opid:STCRACF  userid:CICSUSER Tran:QPU2 task:0057090c
8 Start time Jun 17 06:20:46 2013 Started this interval
8 Interval   Jun 17 06:20:46 2013 - Jun 17 06:20:51 2013 : 4.856374 seconds

TO.QML3	9.82.31.252	Put retry count	0		

Summary

- The tasks records contain a great deal of detailed information about the use of queue managers and queues.
- MP1B gives and very nice formatted view of the individual tasks, which can be helpful when looking problems.
- Learning to look at this data is not fun.
